The apparatus has a packaging device (1), label printer (3) and a label sticking-on device. The packaging device has a packaging on mechanism which applies a film (F) on the upper surface of a lifter. The lifter is provided inside a carrying in mechanism (Z) that conveys goods. The lifter raises the goods and inserts the film on the base of the goods.

A sending out mechanism (Y) conveys the goods packaged to the outer side. The label printer prints and publishes the label (66b). The label sticking-on device sticks the label on film surface. The label printer and label sticking-on device operates parallel with the packaging device.

ADVANTAGE - Reduces time of packaging and labelling. Improves efficiency of packaging. Negates necessary goods movement while packaging. (Dwg.1/19)
